

The use of a well-designed fin configuration can significantly improve the heat transfer performance of a heat sink, resulting in better cooling of the solar panel and improved energy conversion efficiency.

Scientists from the Solar Energy Research Institute (SERI) at the Universiti Kebangsaan Malaysia have developed a passive cooling technique for photovoltaic modules based on the use of...

Increasing their efficiency requires advanced cooling techniques. This study develops an innovative three-dimensional heat sink design for PV cooling by integrating the finite element method ...

This study used a passive cooling system by adding a heat sink with fins to the body panel of the solar cell. The advantage of the passive cooling system is that it does not require additional ...

Six types of heat sink attached to the backside of the PV panel were numerically studied. The analyzed configurations focused on heat sinks with both perforated and non-perforated fins...

Discover innovations in heat sink design for optimal solar cell temperature control, enhancing efficiency and longevity of solar energy systems.

Maintaining PV cells near 25 °C is crucial to avoid efficiency losses. This study explores a novel passive cooling design, photovoltaic perforated wavy-shape fins (PV-PWSFs), using ansys ...

Passive cooling is a widely used method because of its simple equipment, low capital expenditure, low operating and maintenance costs. This paper presents a comprehensive review of recent studies on ...

This work aims to regulate the PV module temperature using passive cooling options such as heat sink, radiative cooling, and combined heat sink and radiative cooling for the extremely ...

In order to determine the most efficient geometry of the heat sink for passive PV cooling applications, the data obtained by the experiment and simulation were numerically analyzed.
