

Should you install solar panels to lower your utility bills?

Homeowners often want to install enough solar panels to lower their utility bills as much as possible. You might think that by designing a solar power system with a solar power offset of 100%, you could eliminate your electric bill from the utility (aside from charges like fixed fees you will always pay to remain connected to the grid).

What is solar offset?

Solar offset measures how much of your annual electricity consumption your solar panels can generate, expressed as a percentage. It's calculated by dividing your system's yearly electricity production by your home's yearly electricity usage.

Can a solar system reduce your electricity bill?

A system sized to produce 100% of a household's average electricity consumption can effectively reduce the electricity bill completely, aside from certain fixed charges that can't be offset, and your electricity costs are the predictable monthly payments for your solar system.

Do you need a 100% solar offset?

You want your solar panels to take care of a majority of your home's energy usage, but even with 100% solar offset, you might still have to buy electricity from the utility company. Depending upon certain factors, you might be able to install a system that fully meets your energy needs.

Ecohouse Solar offers flexible solar leasing solutions in Columbus, Ohio. Make the switch to solar affordable with our customized financing plans.

Solar panels collect sunlight and convert it into electricity using photovoltaic cells. These cells generate direct current (DC) electricity when exposed to sunlight, which is then converted into alternating ...
