

CLEMSON SCE& G Energy Innovation Center is a world-class leading research facility conceived to conduct tests on the next generation off-shore wind turbines. The facility is capable of full-scale, ...

For additional information on these and other testing-related projects funded by the Wind Energy Technologies Office, view the office's research and development projects map and select Program ...

New multidisciplinary cyber-physical testbenches are needed to accelerate the testing of grid-forming wind turbines. Testbench to study all scenarios. This project successfully prototyped a testbench to ...

The NWTC provides wind industry manufacturers, developers, and operators with turbine and component testing all in one convenient location.

In this study, a comprehensive test procedure is developed to test wind turbine generators with a hardware-in-loop setup. The procedure employs the statistical model of the power grid ...

Fraunhofer IWES and the Nordex, Senvion and Vestas turbine manufacturers are collaborating to change this situation and establish the testing of wind turbine electrical properties on ...

All of the above deliver the potential for hosting a holistic test infrastructure for wind energy and this document will deliver test recommendations for test facilities that constitute or interact with the wind ...

China has taken another bold step in the race to build the world's most powerful offshore wind turbines. A new construction tender issued by Huaneng, one of the country's largest state-owned...

Below is the status for EUDP project milestones related to the work by the blade test group. The formulation of the milestones has been changed in order to fit the work done by the blade test group ...

In particular, turbine, nacelle, subsystem, and component testing are reviewed and their advantages and anticipated challenges for evaluating grid code compliance are highlighted.
